Drug Delivery & Formulation

A Range of Solutions for Pharma Customers

Grace is committed to consistently delivering high-quality products to our customers and well-equipped to meet the stringent regulatory demands in the pharmaceutical industry. We believe in seeking collaborative synergistic partnerships.

Fine Chemicals

- Custom Manufacturing
- Kilos to Tons cGMP Production
- Strong Collaborative Relationships

Formulation Excipients

- SYLOID® FP Silica – Trusted in Formulations for 50+ years
- SYLOID® XDP Silica Carrier for LBD - Liquisolid
- SILSOL® Innovative Carrier and Drug Delivery Technologies
- Industry Leading Quality Standards (IPEC-GMP / Excipact)

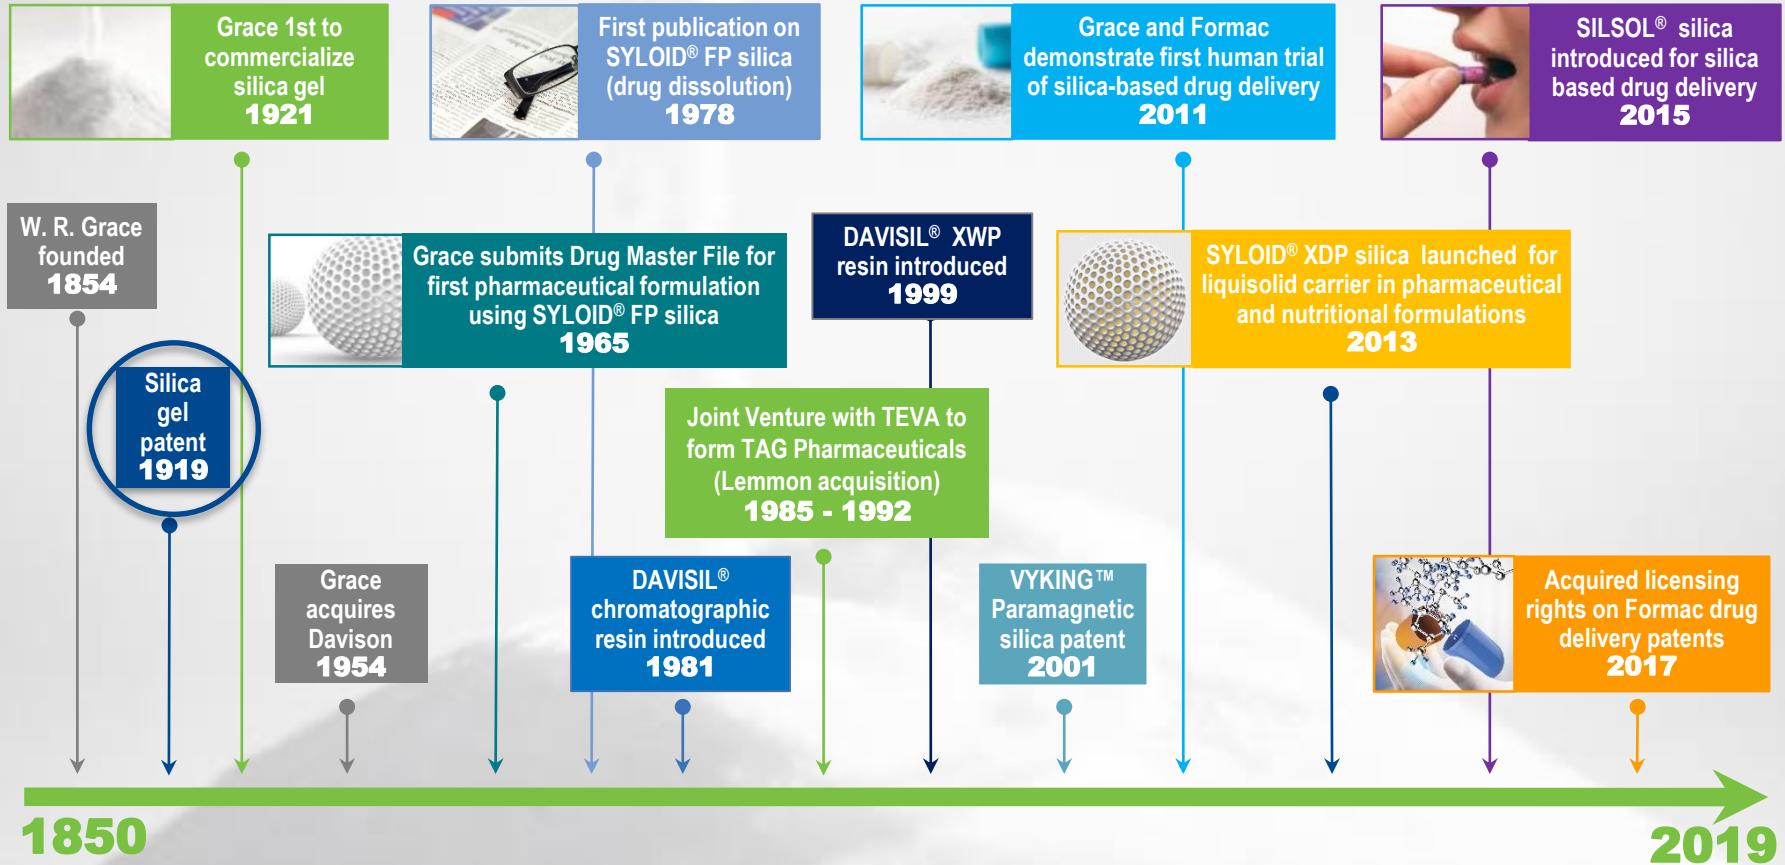

Chromatography Resins

- VYDAC® Protein and Peptide Purification Resins
- DAVISIL® Chromatography Resin for Small and Large Molecules
- Experienced Technical Support

170 Years of Innovation and Silica Expertise

Grace was the first to commercialize silica in 1921 and still innovating 100 years later, as the first to commercialize silica for drug delivery

Innovating in the Pharma Industry for 50+ Years

- In 1965 Grace receives Drug Master File for first pharmaceutical formulation using SYLOID® FP silica
- Today, SYLOID® FP silica is used numerous patented drug formulations including blockbusters such as Allegra®, Plavix®, and Depakote®
- In 1987 VYDAC® Biopurification Resin is patented in Epogen® process
- In 2001 Grace develops and commercializes paramagnetic particles for biopurification
- In 2011 Grace and Formac demonstrate first human trial of silica-based drug delivery
- In 2013 Grace launches new optimized particle SYLOID® XDP silica to be used as a liquisolid carrier in pharmaceutical formulations and nutritional supplements
- In 2016 Grace launches SILSOL® silica drug delivery technology

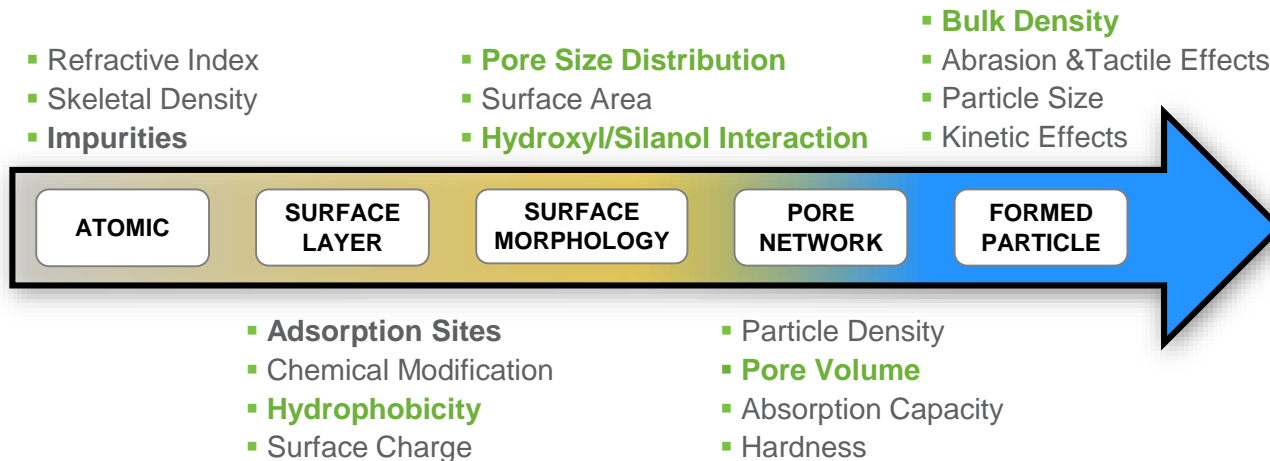

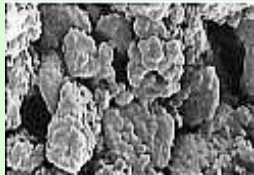

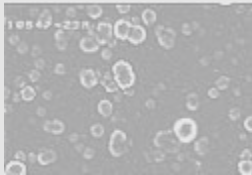

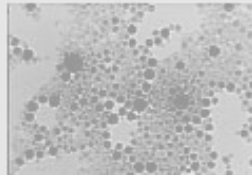

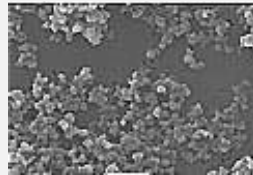

Grace Silica in Pharmaceutical Formulations

Elements of Silica Particle Design

- Multiple Product Types
- Wide Range of Tunable Properties
- Fundamental Understanding of Particle Functionalities
- Experience in a Variety of Applications

Surface, pore, and particle properties can be tuned for specific applications

| Silica Gel | Spherical Silica | Precipitated Silica | Colloidal Silica | Fumed Silica |
|---|---|---|---|---|
| 3-Dimensional network of primary particles | Spray drying of silica slurry | Growing of primary particles; due to the presence of electrolytes, it comes to an agglomeration | Growth of primary particles excluding electrolytes; pH dependent | Pyrogenic process formation of aggregates and agglomerates |
| Pharma | | | | Pharma |

Technologies to address advanced formulation challenges

Fundamentals of Silica Drug Delivery

- The internal mesopores of the hydrophilic silica material are impregnated with a concentrated drug solution
- A stable amorphous phase results from confinement of the API in pores of sub-critical dimensions and/or from the strength of the absorptive interaction (H-bonding)
- On contact with gastric fluids, the confined amorphous drug is rapidly released

Mellaerts et al. Chem Commun (13):1375–1377 – 2007 and Van Speybroeck et al. 2009. J Pharm Sci 98(8):2648–2658.

Solvent-based Strategies

- Pore structure and particle size optimized to provide stable amorphous dispersions
- Robust, scalable processing to load silica
- A number of commercially available drying technologies possible
- Works with most poorly soluble compounds
- Solvent handling capability is an important consideration

Solvent-free Strategies

- Type of silica, pore structure and particle size optimized to provide stable amorphous dispersions
- Robust, scalable co-milling technologies available
- APIs with good H-bonding ability desired
- Critical material attributes and critical process parameters defined
- Next generation: combine hot melt extrusion, mesoporous silica technologies for optimal bioavailability

Where did it all start? Why was there a need for a new carrier ?

“Incomplete Desorption of Liquid Excipients Reduces the *in Vitro* and *in Vivo* Performance of Self-Emulsifying Drug Delivery Systems Solidified by Adsorption onto an Inorganic Mesoporous Carrier”

[Michiel Van Speybroeck](#) - *Mol. Pharmaceutics*, 2012, 9 (9), pp 2750–2760

Liquisolid systems are of interest today not only for NCEs but also in particular for reformulation and life cycle management

Challenges with SEDDS and Liquids

- Difficult to handle
- Unstable - limited shelf life
- Limited capsule compatibility
- Storage temperature must be controlled to prevent degradation
- Inefficiencies of filling causes waste

Limitations of most carriers

- Poor loadability characteristics
- Low volume and density
- Potential interaction with the drug (MAS)
- Desorption problems or low release profiles
- Monograph + freedom to operate limitation

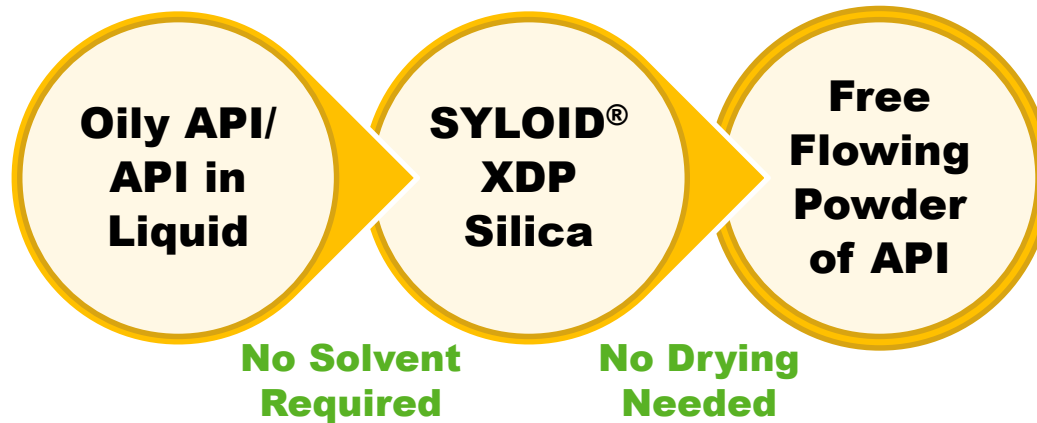

There is a need for more effective carriers!

A grade of Grace® silica designed specifically for liquid and oil-based formulations

Experience the benefits of large particles with true internal porosity

- More API per particle
- Smaller dosage forms
- More efficient release of API
- A novel platform to extend product life-cycle by transforming liquid dosage forms into solids

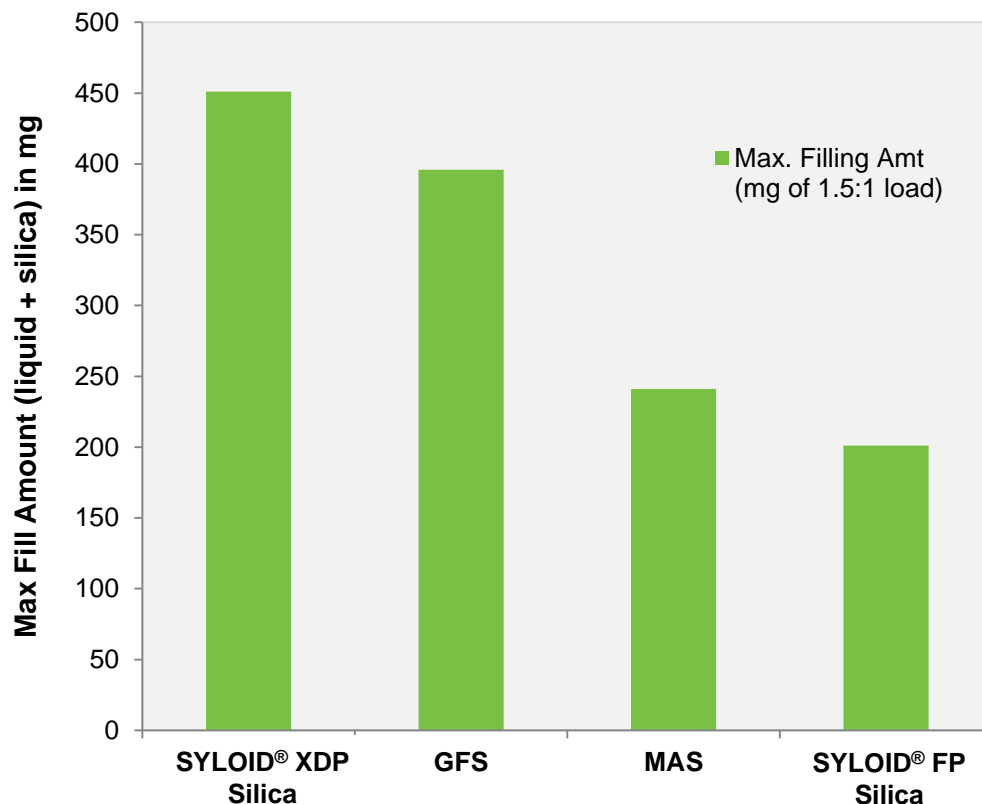

- Most carriers requires the use of solvents to load the lipid to reduce viscosity, followed by drying.
- The morphology of SYLOID[®] XDP silica was designed to promote effective absorption and desorption of lipids.
- Oils can penetrate pores of SYLOID[®] XDP silica without the use of solvents and no surfactant needed.

Simple liquid to solid transformation
1.5:1 ratio is used for capsules 1:1 ratio is used for tablets due to deformation of pores

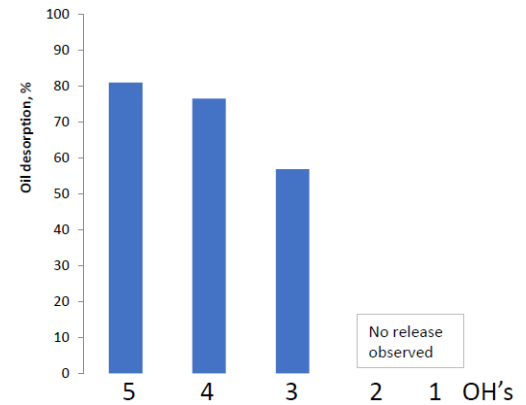

12 carriers and over 30 oils, lipids, surfactants, co-surfactants were tested

Max. Filling Amt (mg) in size 0 capsules

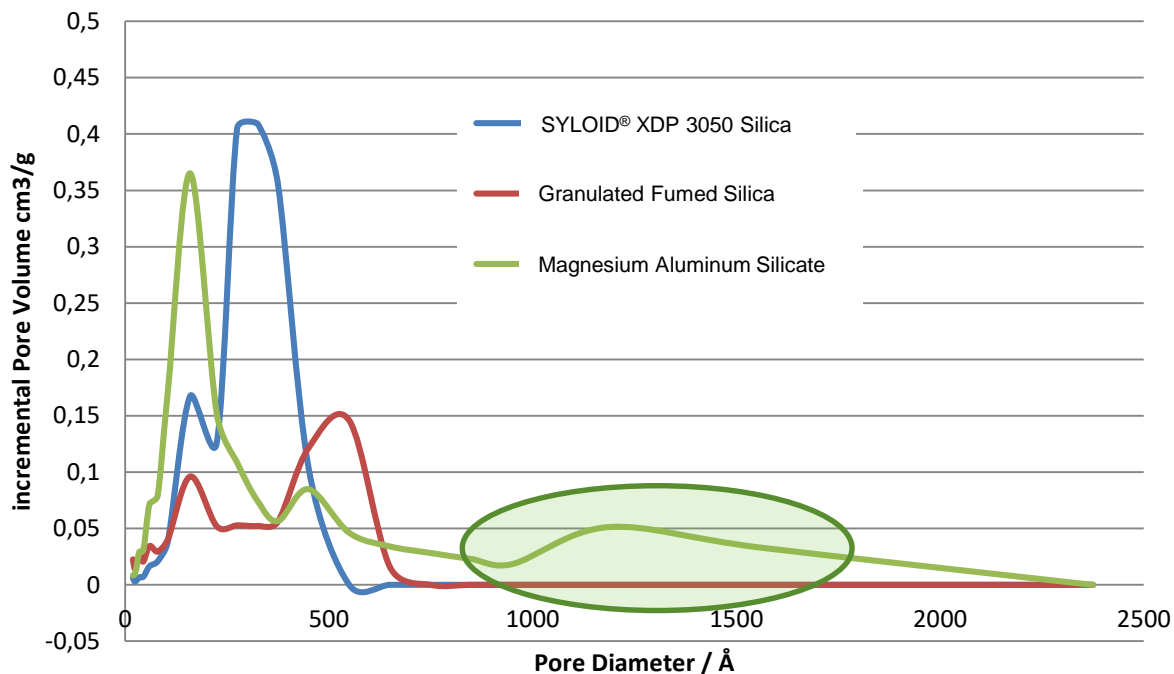

SYLOID® XDP silica carrier gives maximum filling amount per capsule

Oil Release from Carriers

**Incomplete Desorption of Liquid Excipients Reduces the in Vitro and in Vivo Performance of Self-Emulsifying Drug Delivery Systems Solidified by Adsorption onto an Inorganic Mesoporous Carrier [Michiel Van Speybroeck](#) Mol. Pharmaceutics, 2012, 9 (9), pp 2750–2760*

SYLOID® XDP silica carrier gives the best release profile
For MAS the more hydrophilic the better the release

SYLOID® XDP Silica

Granulated Fumed Silica (GFS)

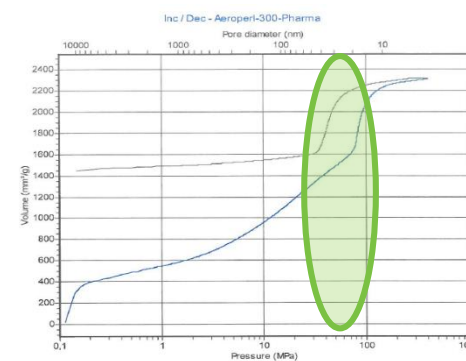

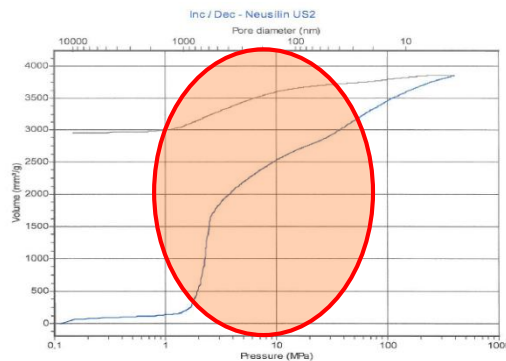

Magnesium Aluminum Silicate (MAS)

Bottleneck pores / Macropores result in incomplete desorption

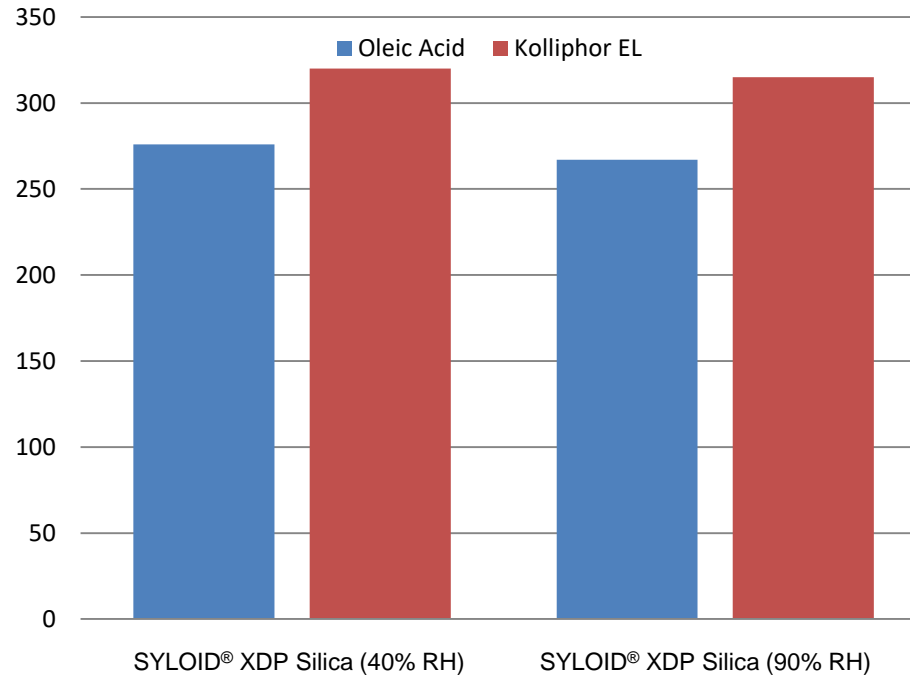

Macroporous Silica

Mesoporous Silica

Effect of Humidity on Absorption

| Carrier | Initial LOD (%) | LOD, 90% RH after 2 days (%) | Max Oil Adsorption, <i>initial</i> (g/100g) | Max Adsorption, 90% RH after 2 days (g/100g) | Decrease (%) |
|---------|-----------------|------------------------------|---|--|--------------|
| MAS | 3.34% | 21.93% | 363 | 336 | 7.43% |
| GFS | 4.72% | 10.58% | 328 | 309 | 5.79% |

EJPB 84 (2013) 172-182 : confirming humidity uptake and potential precipitation of incorporated lipophilic drug with MAS

Humidity has negligible effect on MPS adsorption capacity

Case Studies

Glyburide release comparison for different formulations

Optimization of L-SEDDS required for same dosage strength. Liquid - and Solid-SEDDS have same release!

Different loading strategies provide different release profiles

Objective

- Compatibility of SYLOID[®] XDP silica (empty and loaded) with Gelatine and HPMC capsules.
- Tested as per Capsugel[®] Standard Operating Instructions

Conclusion

- Hygroscopicity: SYLOID[®] XDP silica compatible with capsules stored under standard conditions being %RH 25-65 at 15-25°C
- Mechanical Robustness: No deformation or alteration of mechanical properties
- Disintegration testing: Conform to EP 2.9.1 monograph (total disintegration < 30min)

Table 7: Disintegration of MSG and Cremophor[®] EL loaded MSG capsules (after 3 weeks, at 40°C, 75%RH)

Abstract: *Labrasol[®] and Gelucire[®] 44/14 are lipid-based excipients used for the oral drug delivery of poorly water-soluble drugs. These macroglycerides are composed of acylglycerols and PEG esters, potential substrates of digestive lipases. We developed an in vitro method to simulate the gastrointestinal lipolysis of these excipients and to evaluate the impact of lipolysis in vivo. At the end of the gastric phase, the composition of both excipients was significantly modified underlining the importance of gastric lipolysis in vivo. We also studied the influence of excipients' lipolysis on the solubilization of a poorly water-soluble drug, cinnarizine, in aqueous phase. Gastrointestinal lipolysis of Labrasol[®] was a prerequisite to maintain cinnarizine in aqueous solution, whereas the lipolysis of Gelucire[®] 44/14 did not affect the cinnarizine solubilization.*

Key words: *oral drug delivery, gastrointestinal lipolysis, poorly water-soluble drugs, macroglycerides, lipases, lipid-based formulations*

Solubility enhancement increases with increasing lipophilicity of the compounds and with increasing concentration of the micelles in solution.

From K Valko Physicochemical and Biomimetic Properties in Drug Discovery, Wiley, 2014

This finding supposes that in vivo Labrasol lipolysis is a prerequisite to prevent cinnarizine form precipitation and keep the drug in supersaturation in the gastrointestinal milieu.

From Gattefosse, Vincent Jannin

Quote: “There is a lipolysis in the intestine. It may be possible that some digestions (decomposition) of the lipid delivery system is going on in vivo, that might help to release the drug from the formulation. This also could explain that the bioavailability in vitro is worse than in vivo. Maybe we should add some enzymes in the dissolution media too. It might explain the HLB cutoff too.”

Klara Valko worked for 20+ years at GSK implementing IAM (Immobilized Artificial Membrane) prediction chromatography on 1M+ compounds.

Selection of the right carrier is critical

- Critical Material Attributes (CMA) being :
 - Absorptive capacity in combination with density
 - Volumetric Absorptive Capacity
- Optimum processing conditions / free flow
- Desorptive capacity
 - Pore size + porestructure (Bottleneck)
 - Number of silanol groups on the silica

Grace's Silica Drug Delivery Technology

What does Grace provide?

- Scalable, compendial silicon dioxide
 - U.S. Pharmacopoeia/National Formulary for Silicon Dioxide,
 - European Pharmacopeia for Silica, Colloidal Hydrated
 - Japanese Pharmaceutical Excipients for Hydrated Silicon Dioxide
 - Manufactured to EXCiPACT® standards
- Know-how on loading techniques and analysis
- Application examples and data
- License to practice Grace IP with the purchase of our silica

Thank you for your time.
